_fmt.jpeg) Photoshop can create images that don't really exist — but is that always a good thing? Read on to find out. Photoshop has two types of layers: `_smart_` and `_non_` smart. Smart layers are those that maintain their settings even if the surrounding layers are changed. For example, if you use a smart layer to create a solid white background for your image, the image will maintain that white background if you make changes to the other layers in the image. Non-smart layers are typically used to hold the actual raster file data, so they don't keep their properties when layers are changed. In Figure 6-4, you can see that a smart layer (the image's background) is placed on top of the layers that have been manipulated (the layers to the right). This enables the background to be invisible but still editable if another layer is changed. **Figure 6-4:** Smart layers have their settings preserved if the surrounding layers are changed. Photoshop also uses a retouching tool that enables you to edit the photo in multiple layers so that even hard-to-reach areas of the image can be brought to life. This tool is called the `_lasso_` (see Figure 6-5). You can use it to edit areas of the image based on a line that defines its shape. You can then choose to adjust the color, apply a filter, or change the opacity of the selected area. **Figure 6-5:** The lasso tool allows you to trace the outline of any selected area in order to manipulate it. The next two chapters introduce you to Adobe Photoshop Elements, an easy-to-use image-editing program with many image-editing functions. **Figure 6-6:** A layer mask used to add or subtract one image from another. What's New in the?

This invention relates generally to filters for filtering water and the like, and more particularly to a filter system which includes a filter including a generally elongated body having a plurality of apertures extending therethrough and which filter is formed in a shape which allows a filter to be used to filter and clean the water in a bowl of a toilet, or the like. In addition to filtering the water which is being flushed into a toilet, the filter may also be used to prevent the water from leaking through the toilet when a user is not flushing a toilet, such as to clean the bowl. Over a period of time, most residential water systems include a water pipe which connects a water main to a faucet, faucet, or the like. Water from a water main may include various contaminants such as dirt, suspended contaminants, and the like. In order to protect the water from such contaminants, it is common to filter water at a water faucet. A very popular type of filter utilized for filtering water is a cartridge filter which may include a filter element which is removably disposed in a housing. In one type of known cartridge filter, the filter element is formed of porous media which is an open-ended cylinder having a closed base end and an open top end which is positioned above the open base end. A screen is attached to the open top end of the cylinder, and the open top end is sealed with a membrane. In order to remove contaminants from the water, the water flows through the cylinder, and the contaminants are captured by the cylinder filter. The water flows through the cylinder filter and is then passed through the screen for removal of the contaminants. The above-described type of cartridge filter, however, has several disadvantages. One disadvantage is the lack of a filtering system in the base of the cartridge filter. As a result, the water flows directly through the cylinder filter and may pass through the cylinder filter at a slightly increased rate. Such flow of the water through the cylinder filter is not desirable because the cartridge filter may have a limited lifetime. Therefore, it would be desirable to provide a filter which overcomes the above-described disadvantages. It would be particularly desirable to provide a filter which is relatively inexpensive and which includes a filter element formed into a shape which is readily adapted for use as a toilet bowl filter. Briefly, in accordance with the present invention, a filter system is provided which may include a generally elongated body having a plurality of apertures extending therethrough, the body
