Ambulatory blood pressure monitoring has been established as the most useful technique for the detection and management of hypertension, and for the investigation of pathophysiological mechanisms of hypertension. While the potential benefits of the technique include a greater prognostic value and a greater therapeutic impact, the study of the concept of ambulatory blood pressure monitoring has been limited by the problem of a lack of general consensus regarding its management, and by the lack of an adequate number of studies evaluating the technique for clinical purposes. This paper reviews the present and future uses of the technique for hypertension, taking advantage of the most recent developments in the field.Light guides are well known for guiding and distributing light. For example, light guides may be employed in decorative lighting devices. Light guides may be constructed from translucent materials such as acrylic, polycarbonate, optical fiber, or glass. They may be designed to transmit light from a source to a receiving surface. Light is transmitted from the source by internal reflection, because the light is confined to the guide material, rather than escaping into the surrounding air. Light guides are commonly used in many applications including architectural and vehicle lighting, entertainment lighting, decorative lighting, lighting in automobiles, and the like. As a light guide is capable of guiding light from a light source, the light guide may need to be configured to efficiently distribute light from a light source. There is a trade off between efficient distribution of light within the light guide and the ability to attach the light guide to a light source. For example, the distribution of light within a light guide may be enhanced when the light guide includes a lens. However, the light guide may be attached to a light source such as a light emitting diode ("LED") by soldering or epoxy mounting. Attaching the light guide directly to a1d647c40b
