- The default Widget Engine included with Yahoo! Widgets requires a separate YUI compressor to provide a friendly filename that the widget can accept. [Editor's note: the Yahoo! Widget Engine is a higher version of the standard YUI compressor. It has additional features.]

- Yahoo! Widgets version 2.8 (probably 2.7.4) - A physical CPU. This should not be an issue for most of you, but I still feel it is best to state it up front. - 1.5 MB of free disk space - A way to get to the computer that has the widget on it, and doesn't need a network connection to update or load the widget. This would probably include a home network, a

local ISP, or even a dial-up connection. [Editor's Note: I could not test this in a dial-up environment, but this test script will work in most dial-up environments.] - 60 MB of RAM should be sufficient, but if you want to allow this to run all day long without being constantly refreshed, 150 MB would be a better bet. Installation: - Extract

anywhere on your
hard drive. - On the
computer with the
widget, go to the
root of your hard
drive and make sure
you have one of the
following files: yui_co
mpressor_proxy_201

pressor_proxy_20100
828.zip - Edit the file.
Settings are based
on the included test
script, so don't
change them too
much. - Copy the

widget to the root of your hard drive.

Rename it to something different like

CPUUsageHistory. -

Load the widget into your browser. - This

is where the fun

begins. The widget is not very

configurable, so it will probably work out of the box.

However, I suggest you make some

minor changes to the widget in the default

file `yui_compressor_proxy_20100828.html`
I before you change it any further.
Change the defaults that you don't like.
Go nuts. - Save the changes you make to the widget in the `yui_compressor_proxy_20100828.html` file. -
Make sure the `CPUUsageHistory.swf` file is loaded after `yui_compressor_proxy_20100828.html`. - Go back to the root of your hard drive and

move the

This Widget shows the current CPU usage and total CPU usage within a specified time period. Last updated: Dec 26, 2009 7:30 AM PST :: Version: 1.0.1 :: v1.0.1 The most popular way to search for issues is to locate the latest copy of IBM Hardware Advisor

and click on Find a Problem. A menu item will appear that allows you to search for and select available fixes or view a list of potential problems in the Hardware Advisor. Our newest article on the VCP Web site explores the many benefits of InSight Publisher, a tool for the quick, easy creation and distribution of technical articles,

guides, features, and white papers. This article describes how InSight Publisher assists you with:

- Authoring content
- Creating and customizing your document's templates
- Adding and manipulating diagrams
- Adding and customizing notes and tags
- Validate your work
- Publish your document

Each aspect of the document creation

process is detailed, including creating the document in InSight Publisher, adding content, changing templates, creating diagrams, and exporting the content as a Microsoft Office file or as a PDF file. In addition to creating documents, you can also reuse pieces of content in subsequent documents. We show you how you can

merge and replace snippets of text, and a video tutorial describes inserting standard Microsoft Office objects, including tables, into an InSight Publisher document. If you have specific questions about creating documents using InSight Publisher, you'll find a list of frequently asked questions in the Support section of our

documentation.

CPU Usage History

□ Ever want to know your CPU usage to the millisecond? I have just created a quick app to keep you informed on CPU usage, the current, last and previous values, and history which goes back for the last 400 seconds. It is not based on widget engine, but a stand alone app. Just run the app and you

should see the picture above. It is written in Objective-C and for OS X 10.5 (Leopard) or higher. It will run on Mac OS X 10.4 (Tiger) if you have Runtime Environment 2 installed. Installation: Download [here](#), and double click the zip file to extract it. Unzip to a directory somewhere on your computer. Move or copy the downloaded [resource] to the app

folder. I created a starter application to help. Navigate to your application folder using Finder. Open the [resource] folder and you should see the [data].app.pkg file in there. Drag the file into your Applications folder. That's it! CPU Usage History In order to use the app, you will need Yahoo! Widget Engine 2.0.1 or greater. Google it.

You will need a license. The license is free. License information and a link to download it are included in the [resource] folder.

This widget does not require a license.

Toby Kruger) Q: Can

Sails CRM and Sails.js be used together? I want to use sails to create a CRM webapp with a RESTful API using the Sails.js framework. How can that be done? A: Sails does not depend on any database, but using Postgresql or MySQL is the current best practices (and available in the package managers). However there are various ways you can

integrate sails with other services. The most documented approach would be to use sails-disk for the data persistence (sails

This widget shows a graph that displays CPU usage history for up to 400 seconds. It shows CPU usage and history for up to 400 seconds in a

graphical display similar to task manager in Windows. The resolution, update interval, colors, and size are customizable. I have only tested it on Windows, so I am not sure if it will run on Mac. [Editor's Note: It runs okay on a Mac, but the graph is hard to read on it due to the one pixel line width and rendering differences

between platforms, so it's still marked as Windows only. Mac users can still try this one anyway to see if it's for them.]

Engine CPU Usage

History Description:

This widget shows a graph that displays CPU usage history for up to 400 seconds. Lets you set the number of the worker threads to execute in

parallel. Creates and starts the worker threads with the specified number of threads. Can also be called at boot time with "-N ". [Editor's Note: This is available in 2.0 and above. See the notes below.] Additionally, if you specify a null value for "thread-pct", then the number of threads will be set according to the following formula: $-\frac{N}{Pct}$ The

number of threads will be one-percent of the number of processors. The $-*N/Pct*$ formula works at processor time and not thread time. For example, if the processors are 4, then if the value of Pct is set to 0.25 (25%) then the number of threads will be set to 2, one-quarter of 4. If you set the value of Pct to NULL then the number of threads

will equal the number of processors (4 in this example). Sets the number of threads to the value of the Pct argument and does not wait for them to stop if they are not already running.

[Editor's Note: This is available in 2.0 and above. See the notes below.] If the thread pool has been previously used and has workers already running, then this

function will not start a new set of threads. To avoid this, please use "Shutdown-ThreadPool" to stop the previous thread pool first. Only uses the specified number of threads at once and does not increase the number of threads as the number of workers increase. [Editor
