Highly efficient, low loss Ti₂Co-based lateral nanoarchitectures for plasmonic applications. Highly efficient, low loss plasmonic materials are an essential component of future optical technology. Here, we fabricate a new nanostructure material system based on the heterogeneous alloy Ti(2)Co. The Ti(2)Co alloys exhibit superior plasmonic properties over the individual elements. The new system creates a three-dimensional plasmonic nanoparticle network architecture with low loss. This approach can be applied to other alloy systems and opens the way for highly efficient plasmonic applications.

Fluorophotometric analysis of the toxic effect of a combination of nitrogen and phosphorus fertilizers on the larvae of three species of fish. For the toxic effect of a combination of N-P fertilizers on the larvae of three species of fish, the effect of the nitrogen and phosphorus doses on the oxygen consumption rate of the larvae in the first 24 hr of cultivation was studied using fluorophotometry. No considerable differences were found in the response to different phosphorus doses in the larvae of all fish species studied, while the increased oxygen consumption rate due to N-fertilizer doses was more pronounced in larvae of *Aspius* and *Blicca* and that of *Libellula* spp. The rate of oxygen consumption of all the larvae was greater than that for the control larvae, and at a nitrogen dose of 250 mg/l it was twice as high. It was much less in the larvae of *Libellula* spp. In spite of significant differences in the response to N-fertilizers among the larvae of different fish species, it could be concluded that the measure of the oxygen consumption rate in the first 24 hr of cultivation is a suitable indicator of the toxic effect of N-fertilizers on the larvae of the fish of this study.

Regulation of class I major histocompatibility complex antigen expression in

human immature dendritic cells by corticosteroids. We have characterized the effect of various corticosteroids on expression of the following three classes of MHC class I molecules in immature dendritic cells (DC): (
